Hack-Nocturne '26

Through the night Ideas take flight

Our Idea

Problem we are solving:

- E-commerce, quick commerce, and food delivery platforms heavily rely on **user-uploaded** images for refunds and complaints
- Users manipulate product images using AI tools
- **Expiry dates**, packaging text, and labels are digitally altered to falsely claim refunds
- Manual verification is slow, inconsistent, and not scalable
- There is **no automated** system focused on verifying the authenticity of product visuals

Our Idea – VeriSight:

- An AI-powered **visual verification** system
- **Detects** AI-manipulated product images used in refund and complaint fraud
- Focuses on **expiry date** and packaging manipulation
- Provides authenticity **confidence scores** with explainable insights
- Designed specifically for **delivery-based** platforms

Why should we select you?

- Our team has **experience** working on AI-driven problem statements related to fraud detection and trust
- We focus on real-world problems observed in **e-commerce and delivery** platforms
- VeriSight addresses a current and growing issue caused by **misuse** of AI tools
- The solution is practical, scalable, and **integrable** into existing systems
- Our approach prioritizes original thinking, explainability, and feasibility, not just AI buzzwords
- We aim to build solutions that can be **actually deployed**, not just demo projects

Tech-Stack & Platforms You Mostly Build On

Frontend / Backend

- React
- Python
- **FastAPI**

AI & ML Stack

- Computer Vision (**CNN**-based image analysis)
- Transformer-based models for AI-generated image detection
- **GAN** artifact and texture inconsistency analysis
- **OCR**-assisted text localization (supporting verification, not decision-making)

Cloud / DevOps / Tools

- Cloud-ready, API-first architecture
- **REST APIs** for platform integration

Blockchain & Web3 / Cybersecurity

Thank you

Team: return0
